| Rank | Name              | ATS Score | Reason for acceptance                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------|-------------------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | John Doe          | 85        | John Doe is a strong match for the Software Engineer role. His resume demonstrates extensive experience in software design, development, and maintenance across full development lifecycle. He has hands-on experience with modern programming languages (Python, Java, Go), cloud platforms (GCP, AWS), containerization (Docker, Kubernetes), and CI/CD practices. His work at Google aligns well with the requirement for scalable software solutions and cross-functional collaboration. Additionally, his contributions to open-source projects and certifications further support his technical proficiency and passion for innovation. |
| 2    | Ravi Kumar Sharma | 92        | The candidate is an excellent match for the Software Engineer role. His extensive experience in scalable system design, distributed backend development, and full-cycle software development aligns well with the job requirements. He has hands-on experience with modern programming languages, cloud platforms (AWS), microservices architecture, and performance optimization techniques that are crucial for building high-quality software solutions.                                                                                                                                                                                   |
| 3    | Aarav Mehta       | 72        | The candidate is well-suited for the Software Engineer role due to extensive experience in scalable system design, full development lifecycle involvement, and strong technical proficiency in modern programming languages and infrastructure. His background includes designing and maintaining large-scale AI systems, working with cross-functional teams, and delivering high-quality code with a focus on performance and reliability.                                                                                                                                                                                                  |

|   |                    |    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---|--------------------|----|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4 | Johnathan D. Reyes | 72 | The candidate is well-suited for the Software Engineer role due to strong alignment with key requirements such as software development lifecycle experience, full-stack development skills, and proficiency in modern programming languages. His extensive background in Android development, embedded systems, and system-level debugging demonstrates a solid understanding of software engineering best practices. Additionally, his experience with CI/CD pipelines, performance tuning, and cross-functional collaboration supports the ability to deliver high-quality code that meets business needs. |
| 5 | Justin Green       | 75 | Justin Green meets the requirements for the Software Engineer role with relevant experience in software development, cloud platforms (AWS, GCP), modern web technologies (React, Redux, Node.js, Python/Django), and a strong track record of delivering scalable solutions. His experience aligns well with the job's emphasis on full development lifecycle involvement, collaboration with cross-functional teams, and technical problem-solving.                                                                                                                                                         |

### Rejected candidates

| Rank | Name        | ATS Score | Reason for rejection                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------|-------------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | Ayaan Malik | 52        | The candidate has extensive experience in blockchain development, including smart contract development, DeFi protocols, and DApp creation. However, the resume lacks direct alignment with general software engineering practices such as full development lifecycle involvement, testing methodologies, collaboration with cross-functional teams, and proficiency in mainstream programming languages like Python, Java, or JavaScript frameworks beyond Web3.js. The focus is heavily skewed towards blockchain-specific skills, which do not fully meet the job requirements for a general Software Engineer role. |

## Candidate Summary

John Doe

### HR Evaluation

John Doe's profile aligns very well with the company requirements. He possesses strong technical skills in modern programming languages, has extensive experience in full-cycle software development, and demonstrates a solid understanding of cloud platforms, microservices, and scalable system design. His work at Google and XYZ Technologies showcases his ability to collaborate across teams, lead initiatives, and deliver high-quality software solutions.

### Strengths

- 6+ years of professional experience with proven track record at Google
- Strong proficiency in multiple modern programming languages (Python, Java, Go, C++, JavaScript)
- Extensive cloud experience with GCP and AWS
- Experience with microservices architecture and Kubernetes
- Proven ability to optimize system performance and reduce processing time by 35%
- Strong collaboration skills with cross-functional teams
- Leadership experience in mentoring junior engineers
- Hands-on experience with CI/CD pipelines using Jenkins and Docker
- Relevant certifications (Google Cloud Professional Cloud Developer, AWS Certified Developer)
- Open source contributions and personal project demonstrating initiative and technical depth

### Weaknesses

- Lacks explicit mention of frontend development experience beyond React (though he lists it in skills)
- No specific mention of testing frameworks like Jest or Cypress which are increasingly common in modern full-stack roles
- Limited exposure to newer technologies such as TypeScript, GraphQL, or serverless architectures
- Does not specify any direct experience with agile/Scrum methodologies despite teamwork and collaboration being emphasized
- The resume does not clearly indicate experience working in a startup or small team environment which may be relevant depending on company culture

Ravi Kumar Sharma

### HR Evaluation

The candidate's profile strongly aligns with the company requirements for a Software Engineer role, particularly given

the emphasis on scalable systems, backend expertise, and full development lifecycle experience. His extensive background in designing and implementing distributed systems, microservices, and high-availability architectures matches the technical depth required. The candidate also demonstrates strong leadership, cross-functional collaboration, and a track record of delivering production-grade solutions under pressure.

### Strengths

- Extensive experience in scalable backend systems and distributed architecture (12+ years)
- Proven expertise in key technologies like Kafka, gRPC, DynamoDB, Redis, PostgreSQL, and AWS services
- Strong system design skills with demonstrated success in multi-tenant, low-latency user systems
- Leadership in end-to-end delivery of complex features with zero downtime and high availability
- Experience working at scale with large user bases (70M+ active devices)
- Well-rounded technical skillset including programming languages such as Java, Go, Kotlin, and Python
- Strong communication and thought leadership through speaking engagements and publications

### Weaknesses

- The candidate has a very senior-level profile (Principal/Lead role) which may be overqualified for a mid-level Software Engineer position unless the company is looking for someone to mentor or lead teams
- Limited exposure to frontend technologies or full-stack development, which could be an issue if the role requires broader stack involvement
- No explicit mention of experience with modern CI/CD pipelines or agile practices beyond general collaboration
- Lacks specific mention of testing frameworks or test automation tools beyond JMeter and LoadRunner (may need more detail on unit/integration testing)

## Aarav Mehta

### HR Evaluation

The candidate's profile is highly aligned with the company's requirements, especially given the emphasis on scalable software development, system design, and modern programming practices. The candidate has extensive experience in building large-scale, distributed systems and AI infrastructure, which directly supports the role's need for technical depth and innovation. However, while the candidate excels in AI/ML systems and backend infrastructure, they lack explicit experience in traditional full-stack or general software engineering lifecycle roles that may be required by some organizations.

### Strengths

- Extensive experience in designing scalable AI/ML systems and distributed inference platforms
- Strong technical background in modern tools and frameworks such as PyTorch, TensorFlow, Kubernetes, Docker, gRPC, and Redis
- Proven track record of optimizing performance and reducing latency in production ML systems
- Leadership experience leading cross-functional teams and mentoring engineers
- Deep understanding of system design principles including service orchestration, load balancing, caching strategies, and microservices architecture
- Published research and speaking engagements at top-tier conferences (NeurIPS, OSDI), demonstrating thought leadership
- Strong educational foundation from Stanford University and IIT Delhi

### Weaknesses

- Limited direct experience in general software development lifecycle (SDLC) practices such as agile methodologies or traditional full-stack web development
- No explicit mention of experience with frontend technologies, databases beyond data systems (e.g., PostgreSQL), or enterprise-level application development
- Lacks specific examples of working directly with product managers or business stakeholders in non-technical roles
- Not explicitly experienced in environments where software engineers are responsible for end-to-end ownership from requirement gathering to deployment and maintenance in a traditional engineering context

Johnathan D. Reyes

### HR Evaluation

The candidate has strong technical expertise in Android TV, embedded systems, and OTT streaming platforms, which aligns well with the company's need for a software engineer with experience in scalable, performance-driven development. However, the role emphasizes full-stack or general software engineering across the development lifecycle, while the candidate's background is more specialized in Android and embedded systems. The candidate lacks experience in modern programming languages beyond Java/Kotlin and does not demonstrate exposure to cloud platforms, web-based applications, or general software engineering practices such as agile methodologies or API design.

### Strengths

- Extensive experience in Android TV and AOSP customizations with deep knowledge of media playback optimization
- Proven track record of working on large-scale, high-impact projects at Netflix and other major tech companies
- Strong background in embedded Linux, HAL development, and system-level debugging including JTAG and UART
- Experience with DRM integration (Widevine, PlayReady) and performance tuning for OTT streaming platforms
- Well-versed in CI/CD automation using ADB, emulators, and Jenkins/GitLab for testing across multiple devices
- Educational background in embedded systems engineering and relevant certifications from Google and Netflix

### Weaknesses

- Limited exposure to general software engineering practices, full-stack development, or web-based application design
- No significant experience with modern programming languages outside of Java/Kotlin (e.g., Python, JavaScript, Go)
- Does not explicitly mention experience working with cloud platforms (AWS, GCP, Azure) or microservices architecture
- Lacks explicit documentation or collaboration with cross-functional teams on non-Android related software projects
- No clear evidence of experience in agile/Scrum methodologies or end-to-end software development lifecycle management

## Justin Green

### HR Evaluation

The candidate's profile aligns well with the company requirements. He has extensive experience in software development, particularly with modern web technologies such as React, Node.js, and cloud platforms like AWS and GCP. His hands-on experience in full-cycle development, mentoring junior developers, and delivering scalable solutions demonstrates strong technical and leadership capabilities that match the role's needs.

### Strengths

- Strong proficiency in modern programming languages including JavaScript (ES6, React, Redux), Python (Django), and TypeScript
- Extensive experience with cloud platforms (AWS, GCP) and cost optimization initiatives
- Proven track record of improving customer experiences and operational efficiency through software development
- Experience mentoring junior developers and contributing to team knowledge sharing
- Demonstrated ability to deliver scalable web applications using React, Redux, and modern UI frameworks
- Solid educational background with a Bachelor of Science in Computer Science from Carnegie Mellon University

### Weaknesses

- Limited experience specifically in enterprise or large-scale business software solutions beyond his current role at Xero
- No explicit mention of experience with agile methodologies or DevOps practices beyond CI/CD
- Lacks specific examples of working with cross-functional teams in the context of complex technical problem-solving
- No direct experience or mention of backend-heavy systems or database design at scale
